

R-1009-04 Crash-Rated Bollard Installation

Embedded

Bollards shown in the diagrams may not be the same model as the bollards shipped in this order. This does not affect the integrity of the installation.

To protect the finish, keep bollards in original packaging until exact moment of installation.

Handle with care to avoid scratching or damaging bollard surfaces as abrasions will lead to rust.

Consider local soil conditions before proceeding with bollard installation.

Parts List

| # | PART | QTY |
|---|---------------------|-----|
| 1 | Crash-Rated Bollard | 1 |

Installation Equipment

| | |
|-------------------------|----------------|
| Dirt Tamper | Chalk/Marker |
| Level | Measuring Tape |
| Metal Construction Pipe | Shovel |

Before Installation

STEP 1: Study the site plans and mark the intended location of each bollard on the plan.

STEP 2: Always check for hazards such as water pipes, gas lines, and underground wiring before digging. *Note: You may need a permit to dig to certain depths or in certain locations.*

STEP 3 (Top View)

STEP 5

STEP 8

STEP 3: Plan the layout and dig a rectangular hole with a width of 60", length of 30", and depth of 36".

STEP 4: Set a brace (concrete block or chair) at the bottom of the site. This will elevate the bollard off the subgrade. The bollard should be lifted up enough that the top of the bollard's gusset is flush with the surface grade. The bollard height above grade should be 39.5".

STEP 5: Lower the bollard into the site and onto the brace. *Note: Crash-rated bollards are heavy—to prevent accidents and injuries, ensure the proper resources are available to set into place.*

Pour the Concrete

STEP 6: Only use concrete with a minimum 3000 PSI. Mix the concrete. Check that the proper ratio of water and concrete mix is used—the concrete should have a similar texture to moldable clay.

STEP 7: Fill the site to the top with concrete until it is level with the surface grade.

Set the Bollard

STEP 8: Hold a level against the side of the bollard and ensure that it is plumb. *Note: Once the concrete has cured, there will be no way to make any adjustments.*

STEP 9: Patch the surface around the bollard to make it smooth with the existing surface.

Clean the Bollard

STEP 10: Use a cloth to clean the bollard before the concrete cures.

STEP 11: Be sure to allow enough time for concrete to cure before beginning construction projects on new concrete surfaces. *Note: Moisture in the environment and cool temperatures can significantly slow the process.*

STEP 12: Landscaping material or concrete can be applied around the bollard base to achieve the desired final grade. *Note: Decorative bollard covers can be installed over crash-rated bollards. Please ensure that the cover is large enough to accommodate the crash-rated bollard. To install, please refer to the cover's installation guide.*

STEP 16

Removing the Bollard

This bollard can be removed when necessary and covered with a bollard sleeve cap.

STEP 13: Find the hollow internal tube at the top of the bollard.

STEP 14: Insert a construction pipe through this tube and ensure it is centered. The construction pipe will act as a lifting handle.

STEP 15: Raise the construction pipe and lift the bollard out of the bollard sleeve. *Note: Crash-rated bollards are heavy—to prevent accidents and injuries, ensure the proper resources are available for lifting.*

STEP 16: Cover the opening of the bollard sleeve with the bollard sleeve cap to prevent tripping hazards and debris from getting inside.

Inspect the installation. Abrasions should be covered as soon as possible. For damage repair or other servicing needs, please contact Reliance Foundry's sales department.
